

Tau Introduction

Lars Koesterke
(& Kent Milfeld, Sameer Shende)

Cornell University
Ithaca, NY

March 13, 2009

Outline

- General
 - Measurements
 - Instrumentation & Control
 - Example: matmult
- Profiling and Tracing
 - Event Tracing
 - Steps for Performance Evaluation
 - Tau Architecture
- A look at a task-parallel MxM Implementation
- Paraprof Interface

General

- Tuning and Analysis Utilities (11+ year project effort)
www.cs.uoregon.edu/research/paracomp/tau/
- *Performance system **framework*** for parallel, shared & distributed memory systems
- Targets a general complex system computation model
 - Nodes / Contexts / Threads
- ***Integrated toolkit*** for performance instrumentation, measurement, analysis, and visualization

TAU = Profiler and Tracer + Hardware Counters + GUI + Database

Tau: Measurements

- Parallel profiling
 - Function-level, block (loop)-level, statement-level
 - Supports user-defined events
 - TAU parallel profile data stored during execution
 - Hardware counter values
 - Support for multiple counters
 - Support for callgraph and callpath profiling
- Tracing
 - All profile-level events
 - Inter-process communication events
 - Trace merging and format conversion

Tau: Instrumentation

PDT is used to instrument your code.

Replace mpicc and mpif90 in make files with tau_f90.sh and tau_cc.sh

It is necessary to specify all the components that will be used in the instrumentation (mpi, openmp, profiling, counters [PAPI], etc. However, these come in a limited number of combinations.)

Combinations: First determine what you want to do (profiling, PAPI counters, tracing, etc.) and the programming paradigm (mpi, openmp), and the compiler. PDT is a required component:

Instrumentation	Parallel Paradigm	Collectors	Compiler:
PDT Hand-code	MPI OMP ...	PAPI Callpath ...	intel pgi gnu

Tau: Instrumentation

You can view the available combinations

(alias `tauTypes 'ls -C1 $TAU | grep Makefile '`).

Your selected combination is made known to the compiler wrapper through the `TAU_MAKEFILE` environment variable.

E.g. the PDT instrumentation (`pdt`) for the Intel compiler (`icpc`) for MPI (`mpi`) is set with this command:

```
setenv TAU_MAKEFILE ../../Makefile.tau-icpc-mpi-pdt
```

Other run-time and instrumentation options are set through `TAU_OPTIONS`. For verbose:

```
setenv TAU_OPTIONS '-optVerbose'
```

Tau Example

```
% tar -xvf ~train00/tau.tar
```

```
% cd tau
```

★ READ the Instructions file

```
% source sourceme.csh
```

or

```
% source sourceme.sh
```

create env. (modules and TAU_MAKEFILE)

```
% make matmultf
```

create executable(s)

or

```
% make matmultc
```

```
% qsub job
```

submit job (edit and uncomment ibrun line)

```
% paraprof
```

(for GUI) Analyze performance data:

Definitions – Profiling

- Profiling

- Recording of summary information during execution
 - inclusive, exclusive time, # calls, hardware statistics, ...
- Reflects performance behavior of program entities
 - functions, loops, basic blocks
 - user-defined “semantic” entities
- Very good for low-cost performance assessment
- Helps to expose performance bottlenecks and hotspots
- Implemented through
 - **sampling**: periodic OS interrupts or hardware counter traps
 - **instrumentation**: direct insertion of measurement code

Definitions – Tracing

□ Tracing

- Recording of information about significant points (**events**) during program execution
 - entering/exiting code region (function, loop, block, ...)
 - thread/process interactions (e.g., send/receive message)
- Save information in **event record**
 - timestamp
 - CPU identifier, thread identifier
 - Event type and event-specific information
- **Event trace** is a time-sequenced stream of event records
- Can be used to reconstruct dynamic program behavior
- Typically requires code instrumentation

Event Tracing: *Instrumentation*, *Monitor*, *Trace*

CPU A:

```
void master {  
  trace(ENTER, 1);  
  ...  
  trace(SEND, B);  
  send(B, tag, buf);  
  ...  
  trace(EXIT, 1);  
}
```

CPU B:

```
void worker {  
  trace(ENTER, 2);  
  ...  
  recv(A, tag, buf);  
  trace(RECV, A);  
  ...  
  trace(EXIT, 2);  
}
```

timestamp

Event definition

1	master
2	worker
3	...

...			
58	A	ENTER	1
60	B	ENTER	2
62	A	SEND	B
64	A	EXIT	1
68	B	RECV	A
69	B	EXIT	2
...			

Event Tracing: "Timeline" Visualization

1	master
2	worker
3	...

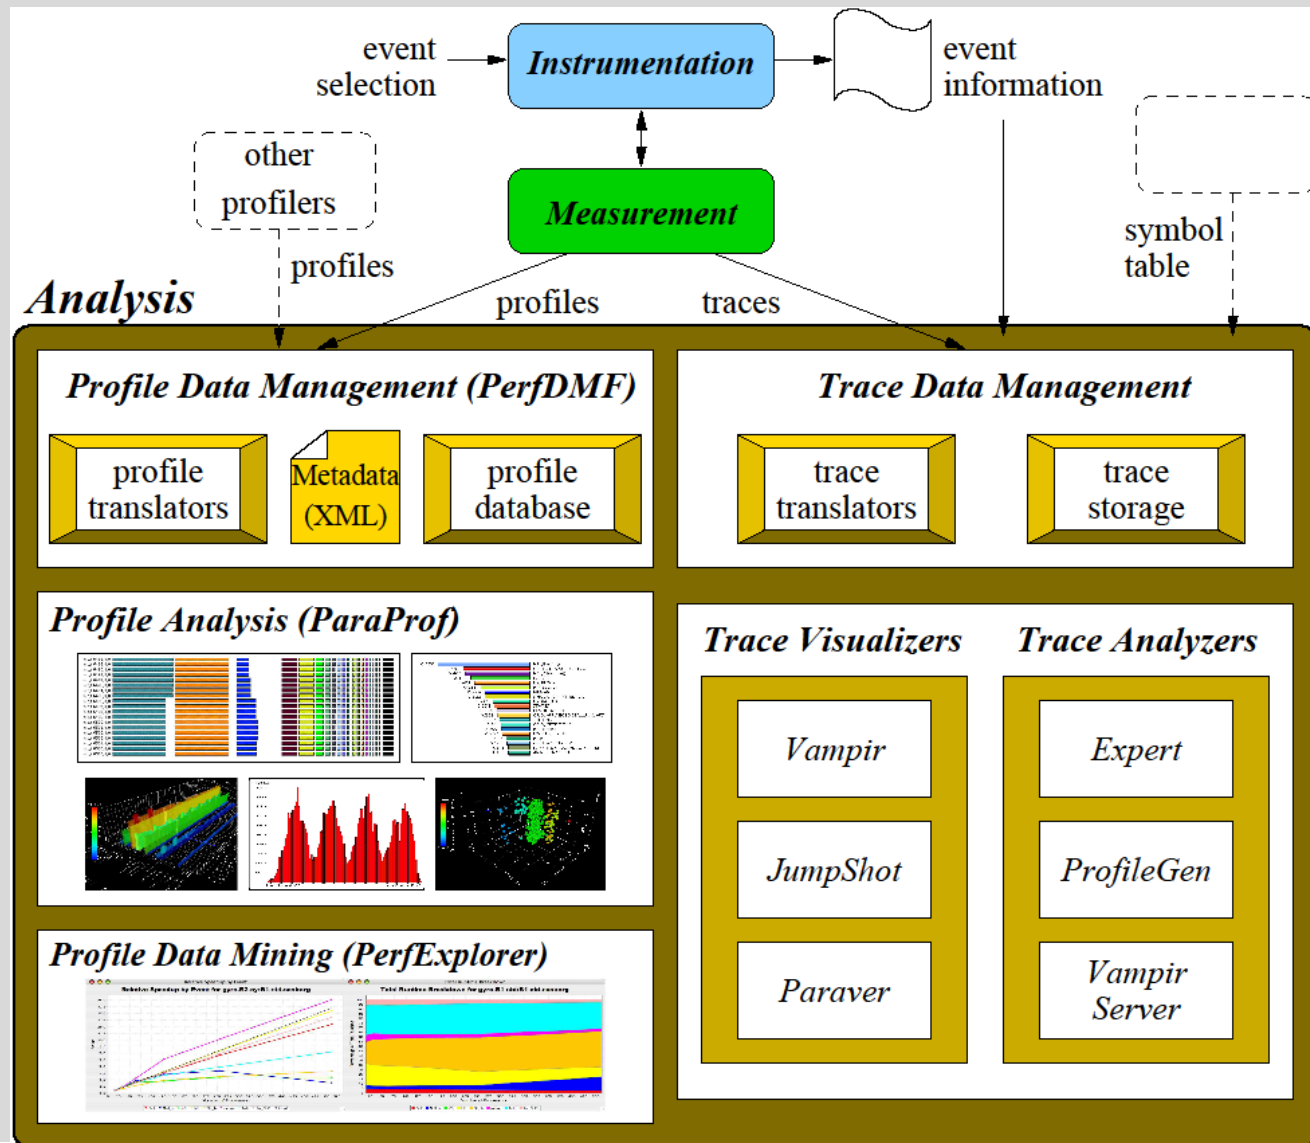

...			
58	A	ENTER	1
60	B	ENTER	2
62	A	SEND	B
64	A	EXIT	1
68	B	RECV	A
69	B	EXIT	2
...			

Steps of Performance Evaluation

- ❑ Collect basic routine-level timing profile to determine where most time is being spent
- ❑ Collect routine-level hardware counter data to determine types of performance problems
- ❑ Collect callpath profiles to determine sequence of events causing performance problems
- ❑ Conduct finer-grained profiling and/or tracing to pinpoint performance bottlenecks
 - Loop-level profiling with hardware counters
 - Tracing of communication operations

TAU Performance System Architecture

Overview of Matmult: $C = A \times B$

$$C = A \times B$$

Order N
P Tasks

MASTER

Worker

Create
A & B

Send B \longrightarrow Receive B

Send
Row of A \longrightarrow Receive a

Multiply row a x B $\dots j \dots = \dots j \dots \times$

Receive
Row of C \longleftarrow Send Back row of C

Preparation of Matmult: $C = A \times B$

$$C = A \times B$$

Order N
P Tasks

MASTER

Generate
A & B

Broadcast
B to All
by columns

loop over i ($i=1 \rightarrow n$)

Master Ops of Matmult: $C = A \times B$

$$C = A \times B$$

Order N
P Tasks

MASTER

Master (0) sends rows 1 through (p-1) to slaves (1→p-1) receives

loop over i (i=1→p-1)

```
MPI_Send(arow ... i, i, destination tag)
```

Master (0) receives rows 1 through (n) from Slaves.

loop over i (i=1→n)

```
MPI_Recv(crow ... ANY, k, source, tag)  
MPI_Send(arow ... idle, j, dest, tag)
```

Master Ops of Matmult: $C = A \times B$

$$C = A \times B$$

Order N
P Tasks

Worker

Pick up broadcast of B columns from PE 0

Slave receives any A row from PE 0

Slaves multiply all Columns of B into A (row i) to form row i of Matrix C

Slave(any) sends row j of C to master, PE 0

Paraprof and Pprof

- Execute application and analyze performance data:
- % qsub job
 - Look for files: profile.<task_no>.
 - With Multiple counters, look for directories for each counter.
- % pprof (for text based profile display)
- % paraprof (for GUI)
 - pprof and paraprof will discover files/directories.
 - paraprof runs on PCs, Files/Directories can be downloaded to laptop and analyzed there.

TAU

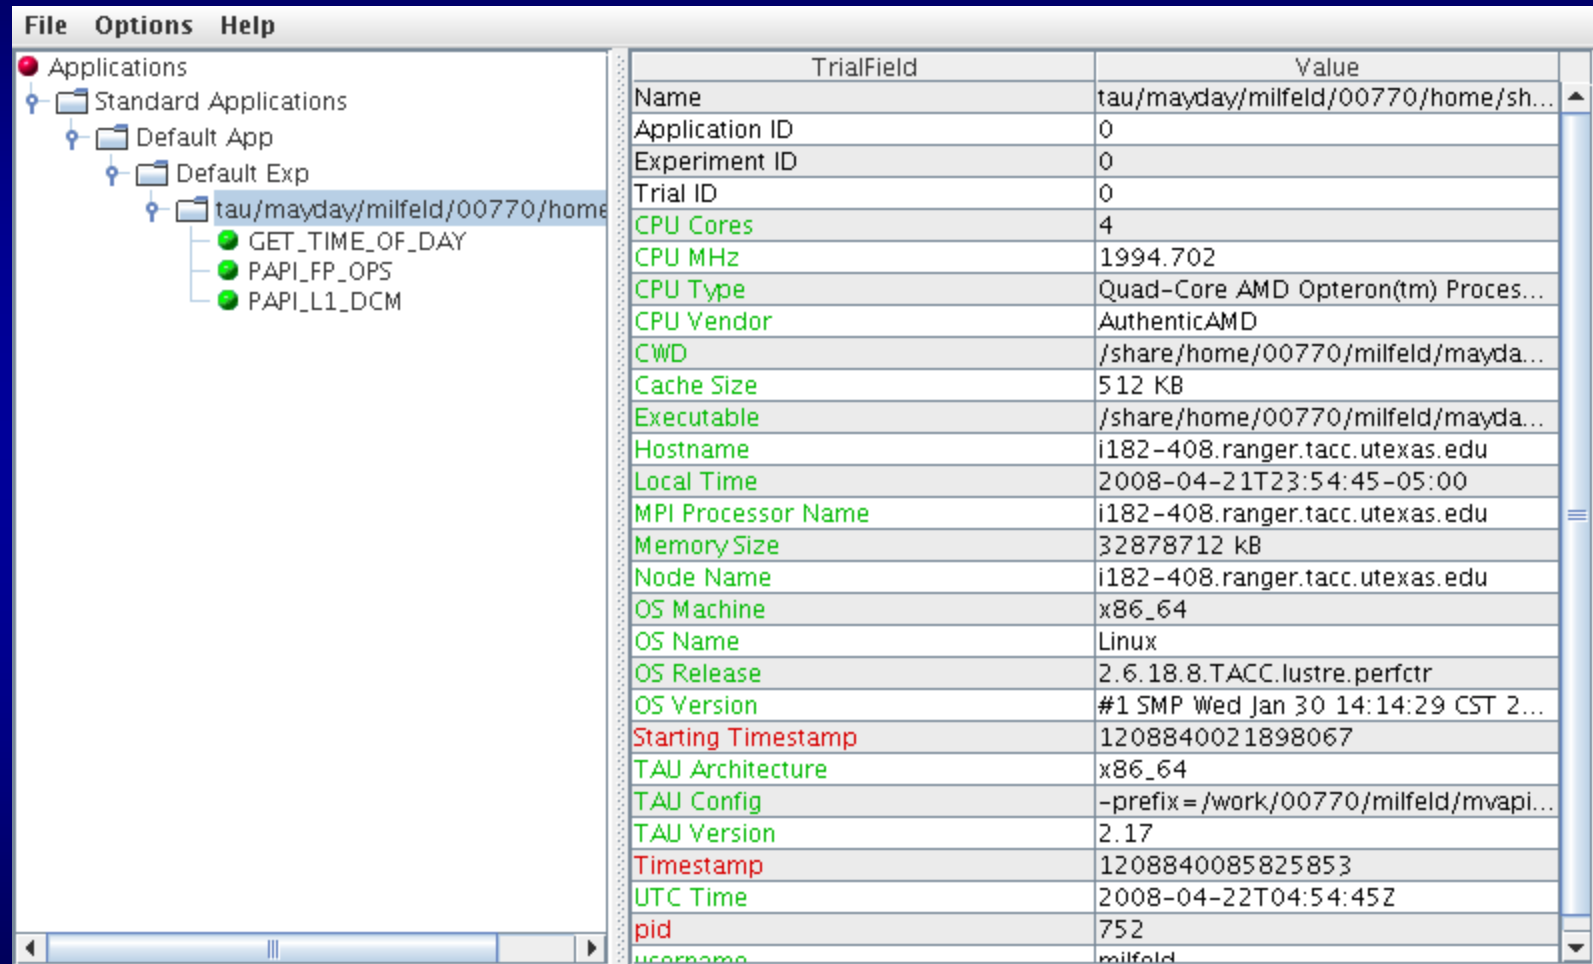

The screenshot shows the ParaProf Manager interface. On the left is a tree view of applications and metrics. On the right are three windows displaying performance data. The top window shows 'Metric Name: PM_CYC (Processor cycles)' with a bar chart. The middle window shows 'Metric Name: Time' with a bar chart. The bottom window shows 'Metric Name: Time' with a bar chart. A table at the top right lists application details.

Name	Field	Time	Value
Application ID		22	
Experiment ID		36	
Trial ID		101	
Metric ID		0	

Tau Paraprof Manager Window

Provides Machine Details

Organizes Runs as: Applications, Experiments and Trials.

The screenshot shows the Tau Paraprof Manager window. On the left is a tree view under 'Applications' with the following structure:

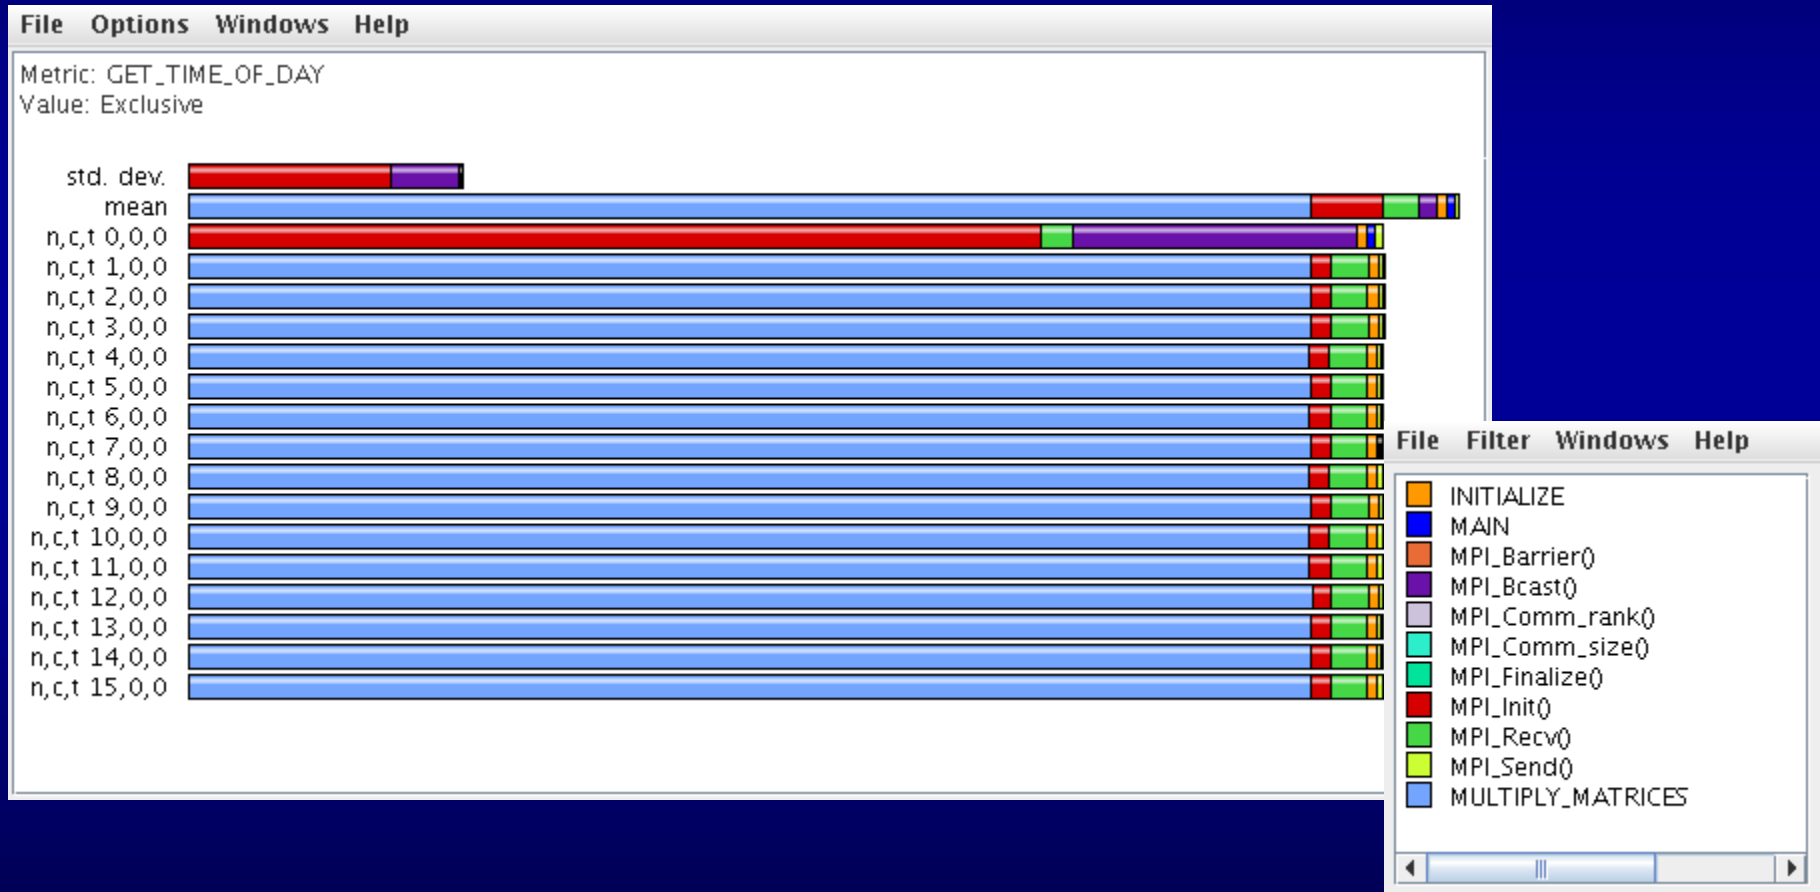

- Applications
 - Standard Applications
 - Default App
 - Default Exp
 - tau/mayday/milfeld/00770/home
 - GET_TIME_OF_DAY
 - PAPI_FP_OPS
 - PAPI_L1_DCM

On the right is a table with the following data:

TrialField	Value
Name	tau/mayday/milfeld/00770/home/sh...
Application ID	0
Experiment ID	0
Trial ID	0
CPU Cores	4
CPU MHz	1994.702
CPU Type	Quad-Core AMD Opteron(tm) Proces...
CPU Vendor	AuthenticAMD
CWD	/share/home/00770/milfeld/mayda...
Cache Size	512 KB
Executable	/share/home/00770/milfeld/mayda...
Hostname	i182-408.ranger.tacc.utexas.edu
Local Time	2008-04-21T23:54:45-05:00
MPI Processor Name	i182-408.ranger.tacc.utexas.edu
Memory Size	32878712 kB
Node Name	i182-408.ranger.tacc.utexas.edu
OS Machine	x86_64
OS Name	Linux
OS Release	2.6.18.8.TACC.lustre.perfctr
OS Version	#1 SMP Wed Jan 30 14:14:29 CST 2...
Starting Timestamp	1208840021898067
TAU Architecture	x86_64
TAU Config	-prefix=/work/00770/milfeld/mvapi...
TAU Version	2.17
Timestamp	1208840085825853
UTC Time	2008-04-22T04:54:45Z
pid	752
username	milfeld

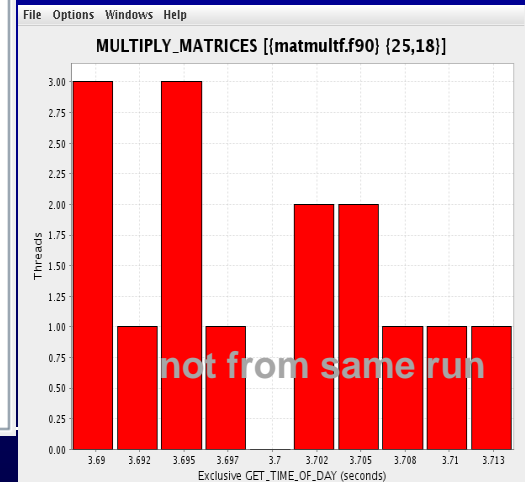

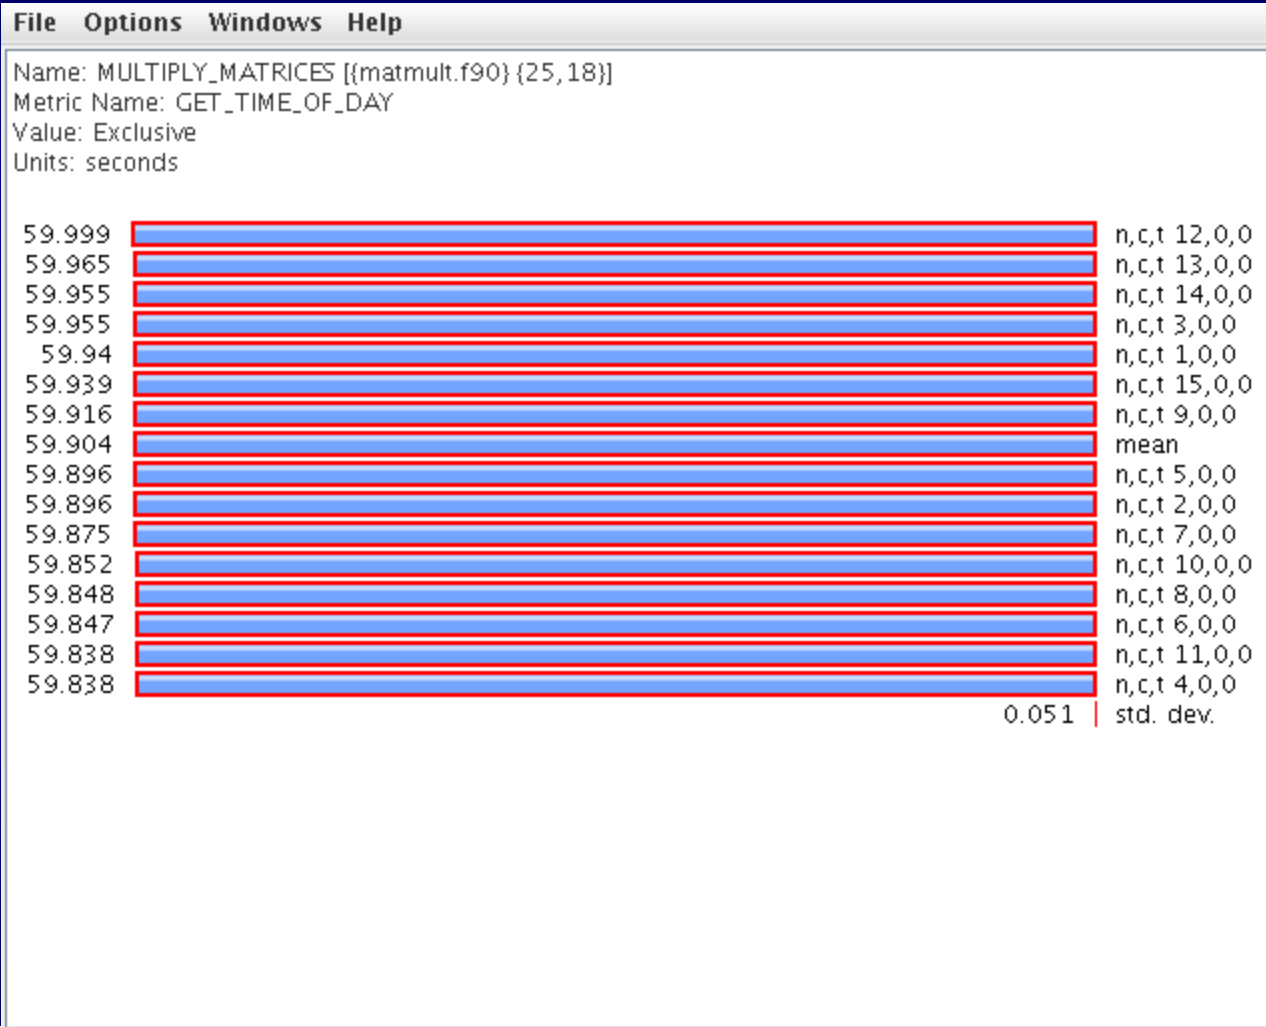

Routine Time Experiment

Profile Information is in “GET_TIME_OF_DAY” metric
Mean and Standard Deviation Statistics given.

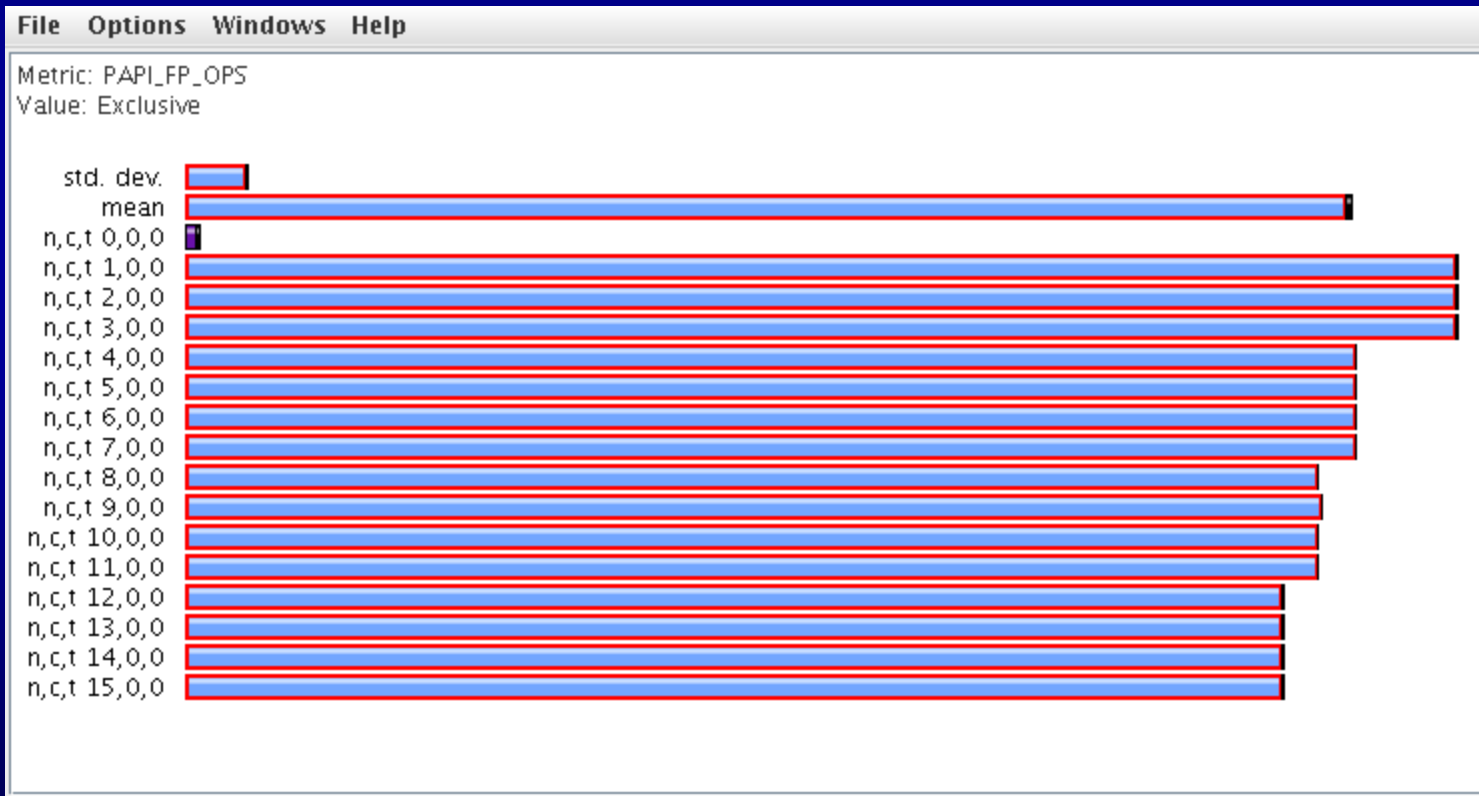

Multiply_Matrices Routine Results

Function Data Window gives a closer look at a single function:

Float Point OPS trial

Hardware Counters provide Floating Point Operations (Function Data view).

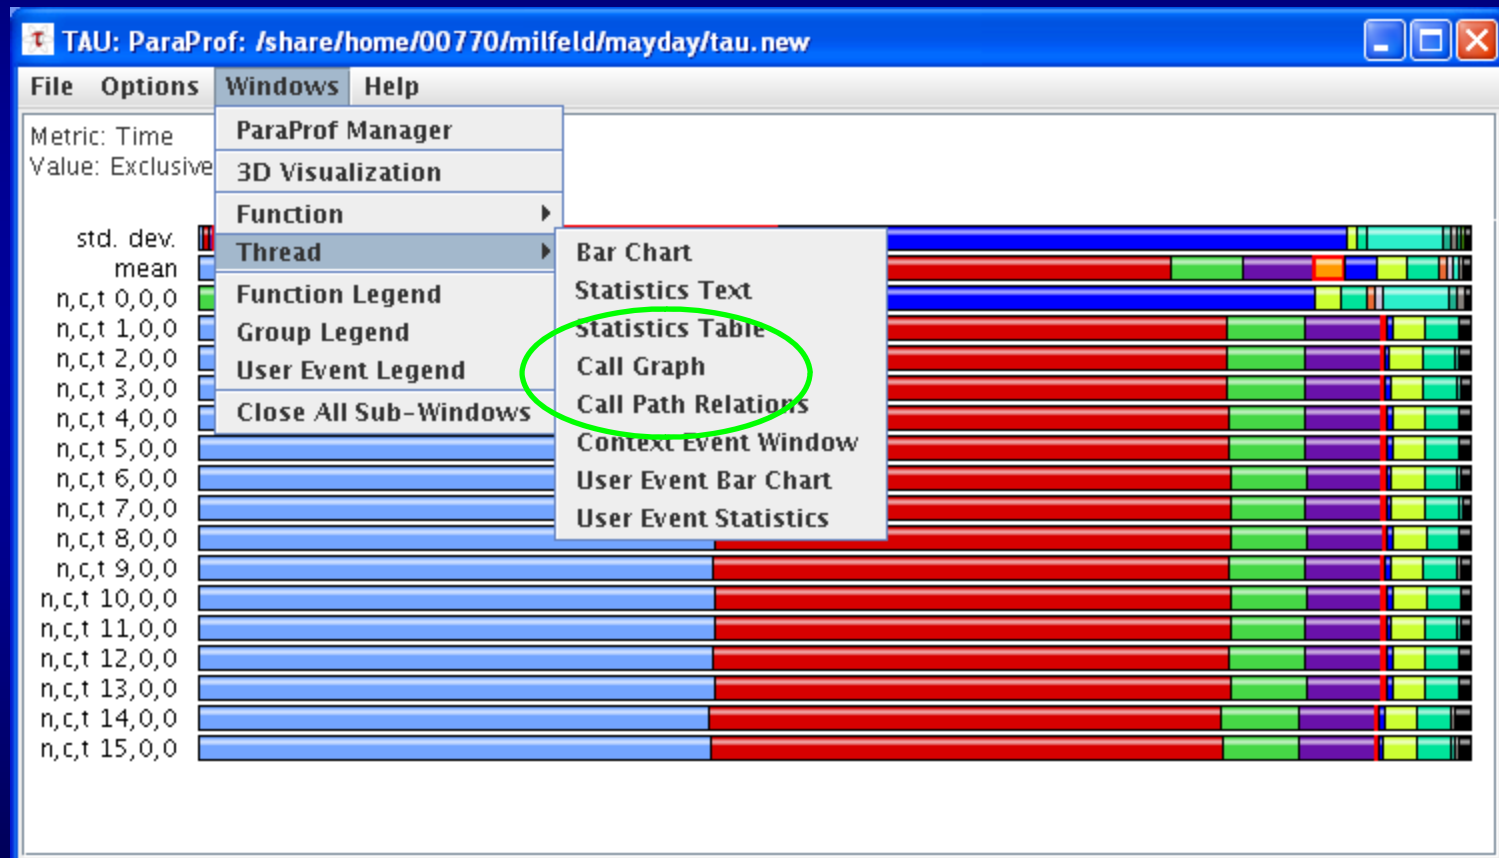

L1 Data Cache Miss trial

Hardware Counters provide L1 Cache Miss Operations.

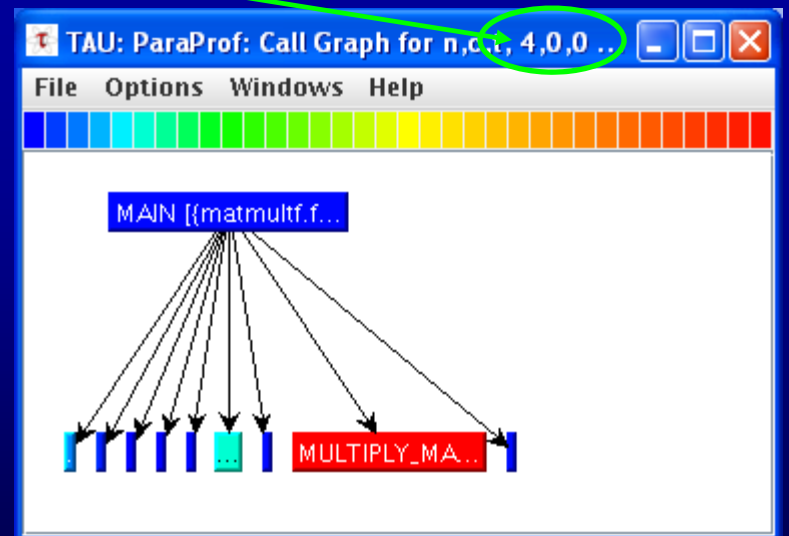

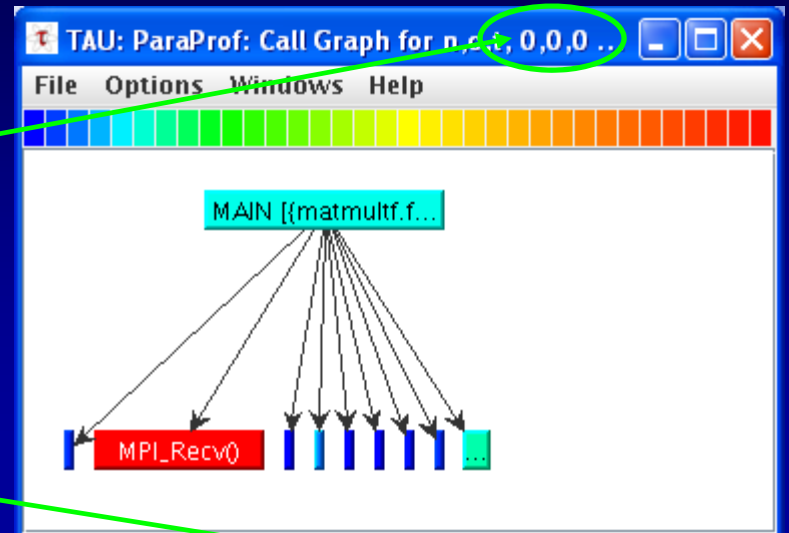

Call Path

Call Graph Paths (Must select through “thread” menu.)

Call Path

TAU_MAKEFILE =
...Makefile.tau-callpath-icpc-mpi-pdt

Derived Metrics

Select Argument 1 (green ball); Select Argument 2 (green ball);
Select Operation; then Apply. Derived Metric will appear as a new trial.

The screenshot shows a software interface with a menu bar (File, Options, Help) and a 'Show Derived Metric Panel'. The panel contains a tree view of metrics and a table of metric fields.

Tree View:

- Standard Applications
 - Default App
 - Default Exp
 - tau/d.test/milfeld/00770/home/s
 - GET_TIME_OF_DAY
 - PAPI_FP_OPS
 - PAPI_L1_DCM
 - PAPI_FP_OPS / PAPI_L1_DCM

MetricField Table:

MetricField	Value
Name	PAPI_FP_OPS
Application ID	0
Experiment ID	0
Trial ID	0
Metric ID	1

Argument 1: 0:0:0:1 - PAPI_FP_OPS

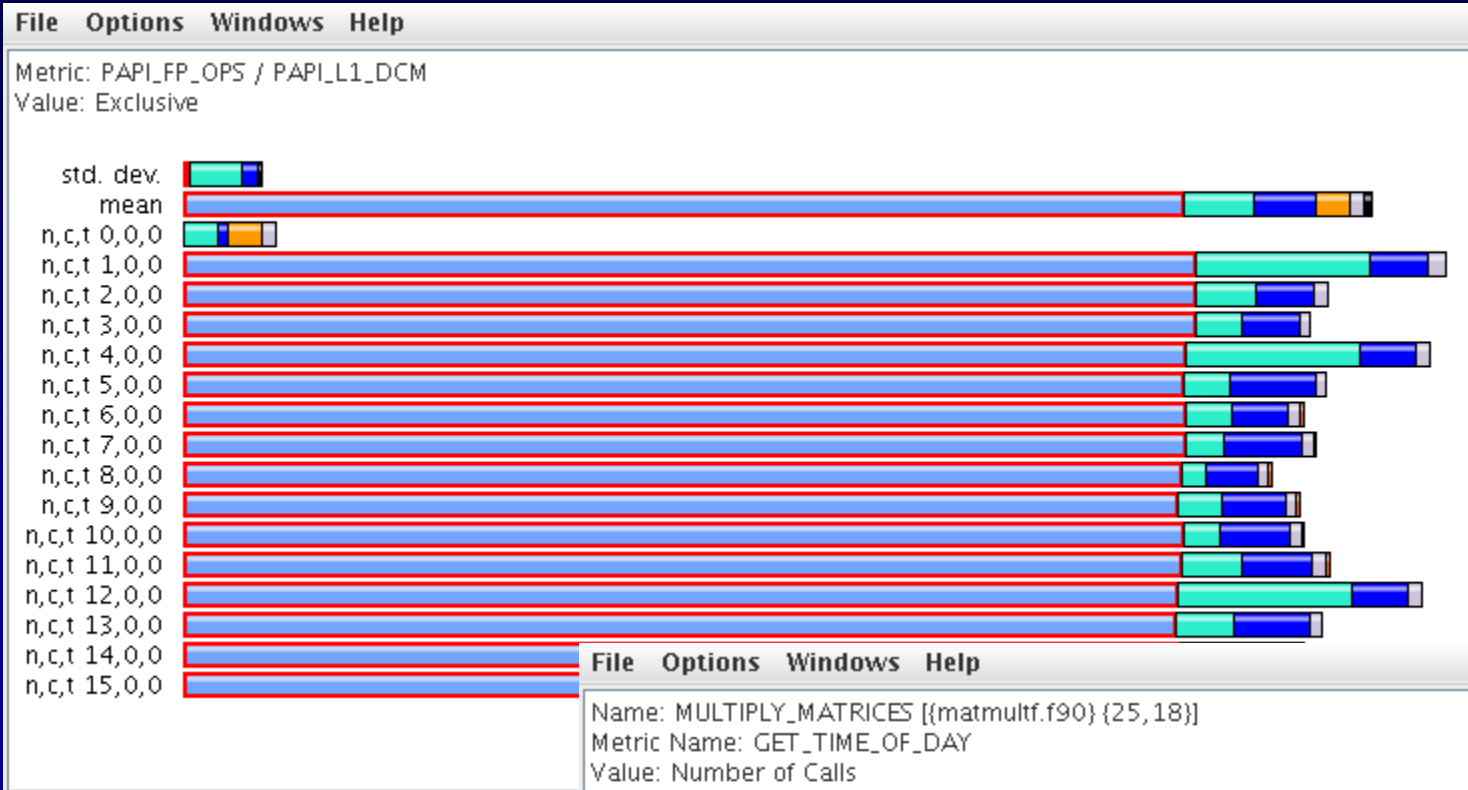

Argument 2: 0:0:0:2 - PAPI_L1_DCM

Operation: Divide

Apply operation

Derived Metrics

Since FP/Miss ratios are constant— must be memory access problem.

Be careful → even though ratios are constant, cores may do different amounts of work/operations per call.

Operating System

Hardware Performance Counter

PAPI Performance Monitor

- Provides high level counters for events:
 - Floating point instructions/operations,
 - Total instructions and cycles
 - Cache accesses and misses
 - Translation Lookaside Buffer (TLB) counts
 - Branch instructions taken, predicted, mispredicted
- PAPI_flops routine for basic performance analysis
 - Wall and processor times
 - Total floating point operations and MFLOPS

<http://icl.cs.utk.edu/projects/papi>
- Low level functions are thread-safe, high level are not

PAPI Preset Events

- Proposed standard set of events deemed most relevant for application performance tuning
- Defined in `papiStdEventDefs.h`
- Mapped to native events on a given platform
 - Run tests/avail to see list of PAPI preset events available on a platform

High-level Interface

- Meant for application programmers wanting coarse-grained measurements
- Not thread safe
- Calls the lower level API
- Allows only PAPI preset events
- Easier to use and less setup (additional code) than low-level

High-level API

- C interface
 - PAPI_start_counters
 - PAPI_read_counters
 - PAPI_stop_counters
 - PAPI_accum_counters
 - PAPI_num_counters
 - PAPI_flips
 - PAPI_ipc
- Fortran interface
 - PAPIF_start_counters
 - PAPIF_read_counters
 - PAPIF_stop_counters
 - PAPIF_accum_counters
 - PAPIF_num_counters
 - PAPIF_flips
 - PAPIF_ipc

Low-level Interface

- Increased efficiency and functionality over the high level PAPI interface
- About 40 functions
- Obtain information about the executable and the hardware
- Thread-safe
- Fully programmable
- Callbacks on counter overflow

PAPI counters in Tau

- Instead of one metric, profile or trace with more than one metric
- Set environment variables COUNTER[1-25] to specify the metric
 - `% setenv COUNTER1 GET_TIME_OF_DAY`
 - `% setenv COUNTER2 PAPI_L2_DCM`
 - `% setenv COUNTER3 PAPI_FP_OPS`
 - `% setenv COUNTER4 PAPI_NATIVE_<native_event>`
- `% setenv COUNTER5 P_WALL_CLOCK_TIME ...`
- When used with `-TRACE` option, the first counter **must** be `GET_TIME_OF_DAY`
 - `% setenv COUNTER1 GET_TIME_OF_DAY`
Provides a globally synchronized real time clock for tracing
- `-multiplecounters` appears in the name of the stub Makefile
- Often used with `-papi=<dir>` to measure hardware performance counters and time
- `papi_native_avail` and `papi_avail` are two useful tools.

Important Environment Variables

- Choose the measurement option and compile your code:
- `setenv TAU_MAKEFILE $TAU/Makefile.tau-icpc-mpi-pdt`
- `setenv TAU_OPTIONS '-optVerbose -optKeepFiles -optPreProcess'`
- `setenv TAU_THROTTLE 1` At runtime to keep instrumentation overhead in check

Fortran TAU Tips

- If your Fortran code uses free format in .f files (fixed is default for .f), you may use:
% setenv TAU_OPTIONS '-optPdtF95Opts="-R free" -optVerbose '
- If it uses several module files, you may switch from the default Cleanscape Inc. parser in PDT to the GNU gfortran parser to generate PDB files:
% setenv TAU_OPTIONS '-optPdtGnuFortranParser -optVerbose'
- If your Fortran code uses C preprocessor directives (#include, #ifdef, #endif):
% setenv TAU_OPTIONS '-optPreProcess -optVerbose -optDetectMemoryLeaks'
- To use an instrumentation specification file:
% setenv TAU_OPTIONS '-optTauSelectFile=mycmd.tau -optVerbose -optPreProcess'
% cat mycmd.tau
 BEGIN_INSTRUMENT_SECTION
 memory file="foo.f90" routine="#"
 # instruments all allocate/deallocate statements in all routines in foo.f90
 loops file="*" routine="#"
 io file="abc.f90" routine="FOO"
 END_INSTRUMENT_SECTION
